Test security and privacy of your mobile application (iOS & Android), detect OWASP Mobile Top 10 and other weaknesses.

Summary of Mobile Application Security Test

APP NAME
Covid Check

APP ID
ch.admin.bag.covidcertificate....

APP VERSION
4.0.0

DEVICE TYPE
Android

TEST STARTED
May 12th 2022, 12:59

TEST FINISHED
May 12th 2022, 13:15

Mobile App Permissions and Privacy	OWASP Mobile Top 10 Security Test	Mobile App External Communications	Software Composition Analysis
3 PERMISSIONS	**2 MAJOR RISKS FOUND**	**5 MAJOR RISKS FOUND**	**12 COMPONENTS FOUND**

Malware test: no malicious code or behavioral patterns detected in the mobile app.

Mobile Application Permissions and Privacy Test

If the application processes or stores any PII of EU residents, the following requirements of EU GDPR may apply:

Privacy Policy

Privacy Policy was not found in application   Misconfiguration or weakness

Mobile Application Functionality

The mobile application requests access to the following functionality that may endanger user's privacy under certain circumstances:

Camera

The mobile application can use the camera for taking pictures or videos.

Mobile Application Permissions

The mobile application requests the following permissions that may endanger user's privacy under certain circumstances:

CAMERA dangerous

Allows application to take pictures and videos with the camera. This allows the application to collect images that the camera is seeing at any time.

ACCESS_NETWORK_STATE normal

Allows an application to view the status of all networks.

INTERNET normal

Allows an application to create network sockets.

OWASP Mobile Top 10 Security Test

The automated audit revealed the following security flaws and weaknesses that may impact the application:

HIGH RISKS	MEDIUM RISK	LOW RISKS	WARNINGS
2	**0**	**4**	**6**

Zero false-positive SLA and advanced manual testing of application is only available in ImmuniWeb® MobileSuite.

WEAK HASHING ALGORITHMS [M5] [CWE-916] [SAST]   HIGH

Description:

The mobile application uses weak hashing algorithms. Weak hashing algorithms (e.g. MD2, MD4, MD5 or SHA-1) can be vulnerable to collisions and other security weaknesses, and should not be used when reliable hashing of data is required.

Example of insecure code:

```
MessageDigest md = MessageDigest.getInstance("SHA-1");
```

Example of secure code:

```
MessageDigest md = MessageDigest.getInstance("SHA-256");
```

Details:

There is **'getInstance("SHA")'** found in file 'ch/admin/bag/covidcertificate/verifier/extensions/ContextExtensionsKt.java':

```
[line 79:      private static final String toShaHash(Signature signature) {]
[line 80:          MessageDigest instance = MessageDigest.getInstance("SHA");]
[line 81:          instance.update(signature.toByteArray());]
```

CVSSv3 Base Score:

5.5 (AV:L/AC:L/PR:L/UI:N/S:U/C:H/I:N/A:N)

Reference:

- https://developer.android.com/reference/java/security/MessageDigest.html

CLEARTEXT SQLITE DATABASE [M2] [CWE-312] [DAST] `HIGH`

Description:

The mobile application uses an unencrypted SQLite database.
This database can be accessed by an attacker with physical access to the mobile device or a malicious application with root access to the device. The application should not store sensitive information in clear text.

Details:

In file revoked-certificates-db:

```
TABLES:
android_metadata
revokedCertificates
sqlite_autoindex_revokedCertificates_1
room_master_table
nationalRules
sqlite_autoindex_nationalRules_1

RAW DUMP:
CREATE TABLE android_metadata (locale TEXT);CREATE TABLE `revokedCertificates`
(`certificate` TEXT NOT NULL, PRIMARY KEY(`certificate`));CREATE TABLE
room_master_table (id INTEGER PRIMARY KEY,identity_hash TEXT);CREATE TABLE
`nationalRules` (`countryCode` TEXT NOT NULL, `validUntil` INTEGER NOT NULL, `rules`
TEXT NOT NULL, `lastModified` INTEGER NOT NULL, PRIMARY KEY(`countryCode`));
```

CVSSv3 Base Score:

7.1 (AV:L/AC:L/PR:L/UI:N/S:U/C:H/I:H/A:N)

HARDCODED DATA [M2] [CWE-200] [SAST] `LOW`

Description:

The mobile application contains debugging or other technical information that may be extracted and used by an attacker to facilitate further attacks.

MISSING TAPJACKING PROTECTION [M1] [CWE-451] [SAST]

LOW

Description:

The mobile application does not have a tapjacking protection required to mitigate tapjacking attacks.
By default, Android OS permits a mobile application to display its user interface over the user interface of another application installed and run on the device. When user touches the screen, application may pass the touch event to another application below its user interface layer that the user does not see, serving like a proxy to pass unintended touch activities. This attack is quite similar to clickjacking but for mobile devices. In order to be successfully exploited, a malicious application shall be already installed on the mobile phone of the victim. An example of exploitation would be a malware app that tricks user to unwittingly tap on a payment button (or any other functionality) of a sensitive application when playing a game or doing other innocent activity in the malicious application screen.

Example of secure code:

```
public class MyActivity extends Activity {
    protected void onCreate(Bundle bundle) {
        super.onCreate(bundle);

        final Button myButton = (Button)findViewById(R.id.button_id);
        myButton.setFilterTouchesWhenObscured(true);

        myButton.setOnClickListener(new View.OnClickListener() {
            // Perform action on click
        }
    }
}

<Button
    android:layout_height="wrap_content"
    android:layout_width="wrap_content"
    android:text="@string/self_destruct"
    android:onClick="selfDestruct"
    android:filterTouchesWhenObscured="true" />
```

Details:

There is **android:filterTouchesWhenObscured="true"** missing in files:
  - android/res/layout-watch/abc_alert_dialog_button_bar_material.xml
  - android/res/layout-watch/abc_alert_dialog_title_material.xml

EXPORTED ACTIVITIES [M1] [CWE-926] [SAST]   LOW

Description:

The mobile application contains exported activities that can be loaded and executed by other applications residing on the mobile device, including malicious ones, to trigger a legitimate application activity.
An activity is an Android component that allows to interact with the application in a particular way (e.g. perform certain actions or functions).

Example of insecure code:

```
<activity
    android:name=".SomeActivity"
    ....
    android:exported="true" />
```

Example of secure code:

```
<activity
    android:name=".SomeActivity"
    ....
    android:exported="false" />
```

Details:

There is **'MainActivity'** found in file 'android/AndroidManifest.xml':

```
[line 11:          <activity android:exported="true"
android:name="ch.admin.bag.covidcertificate.verifier.MainActivity"
android:screenOrientation="portrait">]
```

CVSSv3 Base Score:

3.6 (AV:L/AC:H/PR:L/UI:N/S:U/C:L/I:L/A:N)

TEMPORARY FILE CREATION [SAST]   `WARNING`

Description:

The mobile application creates temporary files. Despite that cache files are usually private by default, it is recommended to make sure that temporary files are securely deleted when they are not required by the application anymore.

Details:

There is **'createTempFile()'** found in file 'kotlin/io/FilesKt__UtilsKt.java':

```
[line 32:          Intrinsics.checkNotNullParameter(str, "prefix");]
[line 33:          File createTempFile = File.createTempFile(str, str2, file);]
[line 34:          createTempFile.delete();]
```

```
[line 55:          }]
[line 56:          return createTempFile(str, str2, file);]
[line 57:      }]
```

```
[line 59:     @Deprecated(message = "Avoid creating temporary files in the default temp
location with this function due to too wide permissions on the newly created file. Use
kotlin.io.path.createTempFile instead or resort to java.io.File.createTempFile.")]
[line 60:     public static final File createTempFile(String str, String str2, File
file) {]
[line 61:          Intrinsics.checkNotNullParameter(str, "prefix");]
[line 62:          File createTempFile = File.createTempFile(str, str2, file);]
[line 63:          Intrinsics.checkNotNullExpressionValue(createTempFile,
"createTempFile(prefix, suffix, directory)");]
[line 64:          return createTempFile;]
```

There is **'createTempFile()'** found in file 'kotlin/io/path/PathsKt__PathUtilsKt.java':

```
[line 675:         Intrinsics.checkNotNullParameter(fileAttributeArr, "attributes");]
[line 676:         Path createTempFile = Files.createTempFile(str, str2,
(FileAttribute[]) Arrays.copyOf(fileAttributeArr, fileAttributeArr.length));]
[line 677:         Intrinsics.checkNotNullExpressionValue(createTempFile,
"createTempFile(prefix, suffix, *attributes)");]
[line 678:         return createTempFile;]
```

```
[line 680: ]
[line 681:     private static final Path createTempFile(String str, String str2,
FileAttribute<?>... fileAttributeArr) throws IOException {]
[line 682:         Intrinsics.checkNotNullParameter(fileAttributeArr, "attributes");]

USAGE OF IMPLICIT INTENT [M1] [CWE-927] [SAST]   WARNING

Description:

The mobile application uses implicit intent that may be insecure under certain conditions.
Intents enable mobile applications to communicate with each other by requesting to perform different actions for which they are better suited. An implicit intent, however, does not specify to which particular application it sends a request to perform an action. If a malicious application is installed on victim's device, it may also receive the implicit intent, respond to it and perform some action instead, or in addition to, a legitimate application.

Example of insecure code:

```
Intent sendIntent = new Intent();
```

Example of secure code:

```
Intent downloadIntent = new Intent(this, DownloadService.class);
```

Details:

There is **'new Intent()'** found in file 'ch/admin/bag/covidcertificate/verifier/zebra/ZebraDataWedgeApiUtil.java':

```
[line 24:     public final Intent getEnumerateScannersIntent() {]
[line 25:         Intent intent = new Intent();]
[line 26:         intent.setAction(DATA_WEDGE_API_ACTION);]
```

```
[line 31:     public final Intent getCreateProfileIntent() {]
[line 32:         Intent intent = new Intent();]
[line 33:         intent.setAction(DATA_WEDGE_API_ACTION);]
```

```
[line 66:         Bundle bundleOf = BundleKt.bundleOf(pairArr);]
[line 67:         Intent intent = new Intent();]
[line 68:         intent.setAction(DATA_WEDGE_API_ACTION);]
```

USAGE OF INTENT FILTER [M1] [CWE-927] [SAST]   `WARNING`

Description:

The mobile application uses an intent filter that may be a serious security risk if not properly implemented and filtered. Developers should not solely rely on intent filters for security purposes because they place no restrictions on explicit intents. Intent filters are defined in the Android Manifest file, they let developers choose which type of intents their application components are supposed to receive and handle.

Example of insecure code:

```
<intent-filter>
    <action android:name="android.intent.action.VIEW" />
    <action android:name="android.intent.action.EDIT" />
    <action android:name="android.intent.action.PICK" />
    <category android:name="android.intent.category.DEFAULT" />
    <data mimeType:name="vnd.android.cursor.dir/vnd.google.note" />
</intent-filter>
```

Example of secure code:

```
// When you use intent-filter, you have to perform input validation in your code.
```

Details:

There is **'<intent-filter>'** found in file 'android/AndroidManifest.xml':

```
[line 11:          <activity android:exported="true"
android:name="ch.admin.bag.covidcertificate.verifier.MainActivity"
android:screenOrientation="portrait">]
[line 12:              <intent-filter>]
[line 13:                  <action android:name="android.intent.action.MAIN"/>]
```

DYNAMIC LOAD OF CODE [M7] [CWE-94] [SAST]   WARNING

Description:

The mobile application uses dynamic load of executable code. Under certain circumstances, dynamic load of code can be dangerous. For example, if the code is located on an external storage (e.g. SD card), this can lead to code injection vulnerability if the external storage is world readable and/or writable and an attacker can access it.

Example of insecure code:

```
Object test = loader.loadClass("Test", true).newInstance();
```

Example of secure code:

```
// If you are using code from unsafe place (like external storage),
// you should sign and cryptographically verify your code.
```

Details:

There is **'ClassLoader'** found in file 'j$/time/zone/ZoneRulesProvider.java':

```
[line 57:                     try {]
[line 58:                         ZoneRulesProvider zoneRulesProvider =

OBJECT DESERIALIZATION FOUND [M7] [CWE-502] [SAST]   `WARNING`

Description:

Object deserialization performed on an untrusted resource (e.g. user-supplied input or external storage), can be dangerous if the data for deserialization is tampered by an attacker.

Example of insecure code:

```
bundle.putSerializable("exampleClass", exampleOfSerializabledClass);
exampleOfSerializabledClass = bundle.getSerializable("exampleClass");
```

Example of secure code:

```
// Use only serialization when you have the control over data
```

MISSING ANTI-EMULATION [SAST]   WARNING

Description:

The mobile application does not use any anti-emulation or anti-debugger techniques (e.g. detecting rooted devices or checking if contacts are authentic).
This can significantly facilitate application debugging and reverse-engineering processes.

Reference:

- https://github.com/strazzere/anti-emulator

External Communications and Outgoing Traffic

Mobile Application Endpoints

Static mobile application security test revealed the following remote hosts where the mobile application may send or receive data:

Hostname	IP:Port	SSL Encryption	Websec Server Security	Domain Domain Security
javax.xml.xmlconstants:80	Not Resolved:80	Not Tested Yet	Not Tested Yet	Not Tested Yet
www.cc-d.bit.admin.ch:443	54.230.51.107:443	Not Tested Yet	N	Not Tested Yet
www.cc-a.bit.admin.ch:443	13.225.195.89:443	Not Tested Yet	N	Not Tested Yet
www.cc.bit.admin.ch:443	13.225.195.29:443	Not Tested Yet	N	Not Tested Yet
tools.ietf.org:443	4.31.198.62:443	C+	C	Not Tested Yet

Software Composition Analysis Test

The mobile application uses the following external and native libraries:

External

- net.i2p
- j$.wrappers
- j$.util
- j$.time
- j$.lang
- j$.retarget
- kotlinx.serialization
- kotlinx.coroutines
- io.jsonwebtoken
- COSE

Android Native

- androidx.transition
- androidx.tracing
- androidx.collection
- androidx.exifinterface
- androidx.room
- androidx.core
- androidx.drawerlayout
- androidx.interpolator
- androidx.versionedparcelable
- androidx.security

- com.upokecenter
- com.fasterxml

- androidx.emoji2
- androidx.activity
- androidx.camera
- androidx.viewpager
- androidx.resourceinspection
- androidx.vectordrawable
- androidx.lifecycle
- androidx.legacy
- androidx.documentfile
- androidx.annotation
- androidx.sqlite
- androidx.print
